Managed Threat Detection

Today's advanced malware exploits and other cyber attacks demand the most advanced threat protection.

Cyber Vigilance's Managed Threat Detection provides proactive security to ensure your organisation has effective security controls in place, reducing the risk of a cyber incident. Powered by SentinelOne, our service rapidly and accurately identifies, remediates, and reports on threats in your environment backed by our 24/7 team.

Key Features

Prevention and Detection - Our Managed Threat Detection service is powered by leading endpoint protection technology, SentinelOne. Built-in Static AI and Behavioural AI analysis prevent and detect a wide range of attacks in real-time before they cause damage, including malware, trojans, hacking tools, ransomware, memory exploits, script misuse, bad macros, and more.

24/7 Monitoring - Having effective security tools in place is not always enough. Our MTD service monitors your security around the clock, so you can be confident that every threat can be responded to no matter the time. Our team will use threat intelligence captured by SentinelOne and expertise to identify legitimate activity from the real threats.

Security Hygiene - Get insights into vulnerable third-party applications which have known vulnerabilities mapped to the MITRE CVE database. Discover any rogue devices on your network which SentinelOne does not yet cover.

Threat Hunting - Our team are able to understand the behaviour of your endpoints and accurately detect and respond to any anomalous activity with incident storylines and MITRE ATT&CK alignment.

Reports - To give you complete visibility into how you are being protected, we will provide you with regular reports and cadence meetings.

Remediation - With a full range of manual and automated response capabilities, our team can quickly respond to detected threats, including the ability to roll back to reverse any unauthorised changes from an attack.

Managed Threat Detection

Key Benefits

Reduced response time - 1-click remediation and rollback capabilities mean threats can be mitigated rapidly.

24x7 monitoring of your environment - giving you confidence that there will always be someone ready to respond to a threat.

Protect against modern-day threats - Detect against a wide range of attacks, powered by leading technology SentinelOne.

Complete visibility - With contextualised alerts and monthly reports, you'll have in-depth visibility into your threats.

Cyber security partnership - Our team become your team, providing guidance and expertise on security best practices.

Concentrate on what really matters - You'll be able to focus on your usual tasks by leaning on our team to handle any threats.

Ready to respond 24/7

The Managed Threat Detection service is backed by a 24/7 SOC, ready to respond and analyse any threats in your environment. Every threat is reviewed, acted upon, and documented to keep you in the loop with proactive notifications.

While our Managed Threat Detection service offers auto-remediation capabilities against most threats, there may be cases where the Cyber Vigilance team proactively identifies a compromise in which active response is required. In this case, we will investigate, mitigate, and report on the incident.

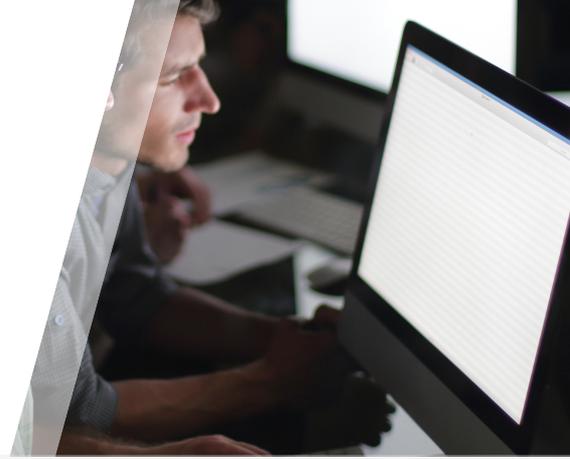

Why Cyber Vigilance?

Deploying and managing your own threat detection service requires highly skilled cyber security experts to monitor your environment 24x7. Understandably, it is challenging to implement this without the required skills, time and budget, meaning that threats are more likely to go undetected for longer.

Cyber Vigilance is your trusted cyber security partner, acting as an extension of your own team, removing the headache and costs associated with building an in-house SOC. Combining our expertise and best-of-breed technology means you can have peace of mind that your organisation is in a safe pair of hands.

Managed Threat Detection

How the service works

Cyber Vigilance's Managed Threat Detection Service provides the most comprehensive protection for your organisation. If a threat has bypassed the organisation's security perimeter, we will find it, kill it and understand its origins.

We can rapidly deploy to thousands of endpoints, meaning the service can be up and running quickly. Once deployed, your environment will immediately be scanned for potentially malicious threats, ensuring your organisation is protected as quickly and effectively as possible.

When a threat is detected, we perform immediate remediation to minimise the impact on your organisation and reduce your time to recover. Cyber Vigilance performs advanced analysis of threats to identify the root cause of a security breach.

We keep you up to date with regular cadence calls and monthly reports, giving you complete visibility on how we are protecting your environment.
